ENDOMETRIAL BIOPSY

You will be given a medication called Cytotec to take before the procedure. There will be two pills that must be taken as directed by the provider. This is done in order to minimize the discomfort of the biopsy. We will also offer you Ibuprofen to take before the procedure to help with cramping.

The cervix will be cleaned with an antiseptic liquid and then grasped with an instrument (tenaculum) to hold the uterus steady. A small hollow plastic tube is gently passed into the uterine cavity. Gentle suction removes a sample of the lining. The tissue sample and instruments are removed.

We do require that you return to the office two weeks post endometrial biopsy to go over your test results.

Nothing is to be put into the vagina for two weeks post procedure.
